

# What positioning options do CasaBeds offer?

## No Profiling

Users may not always want to have their legs or back elevated. If this is the case they can simply set the bed to its flat or almost flat position.

## Leg Elevation

Leg elevation helps to reduce fluid and pressure in your legs and ankles, making it an ideal position to soothe away aches and pains from tiredness or injury.

## Back Elevation

Back elevation offers great general positioning. CasaBeds can elevate your back by up to 70°, offering comfort and support for relaxing, reading, watching television or even eating in bed. Some people also find back elevation helps to relieve respiratory conditions.

## Back Elevation with Leg Elevation

This position enables users to achieve the benefits of both back and leg elevation. Back and leg elevation can also help users get into and out of bed safely and easily.

## Knee Brake

Allows the user to lie flat with the knees bent, offering additional support for the knee area.

## Back Elevation with Knee Brake

Offers great general positioning for the user, with comfort and support for the back and knee area.

## Trendelenburg

Allows the user's feet to be raised higher than the head, for a variety of medical purposes. Ideal for postural drainage, this position should only be used under professional supervision.

## Anti-Trendelenburg

This position provides added pressure relief for various areas of the body. Must only be used under medical supervision.
